

EDITOR'S SPEAK

Neurotology

Neurotology is a vast subject. With functional assessment and imaging forming the mainstay of diagnostic modalities available, numerous limitations present themselves to the practicing clinician.

From an oversimplified compartmentalization between vestibular and audiological disorders, this subject has expanded greatly. Today clinicians are evaluating associations between systemic disorders and the inner ear in an attempt to explain issues that were erstwhile termed as 'idiopathic'. On the other hand, surgeons are attempting to intervene in patients who may have been otherwise deemed untreatable. It's fascinating to see how rapidly this field of Neurotology is expanding; yet a few clinicians are keenly interested in it.

This issue is one of many such dedicated to this fascinating and still minimally explored field of Neurotology.
