Neck Pathologies

The neck is one anatomical area that is collectively treated by otorhinolaryngologists, general surgeons, oncosurgeons, pediatric surgeons, plastic surgeons, and many more; and rightfully so, as the plethora of pathologies that can affect the neck primarily and secondarily can be overwhelming, both quantitatively and qualitatively.

This issue deals with numerous pathologies affecting the neck and its surrounding anatomical areas. Certain rare and seldom encountered lesions have also been described here. While most patients have been managed by otorhinolaryngologists as the primary treating clinician, often the role of "supportive" departments, such as the ones mentioned above cannot be stressed more; this again reminds us of the fact that often the management of neck pathologies needs a multidisciplinary team approach.
